

Monitor One

by MAXIMUS

See every house, every day.
Before small issues
become losses.

*“The real risk is not the failure.
It’s not seeing it in time.”*

Everything is working...

Until it isn't

Ventilation is running

A controller fails ⇒ temperature climbs ⇒ stress rises ⇒ mortality increases

Feed keeps flowing

A silo runs low/delivery slips ⇒ intake drops ⇒ performance falls

You roll out a new feed program

Uniformity starts drifting ⇒ FCR worsens ⇒ results become unpredictable

Water supply looks steady

A water line stops ⇒ dehydration shows up fast ⇒ disease pressure increases

And when someone notices...
it's already too late.

Production rarely fails all
at once.

Visibility fails first.

In many operations:

- Issues aren't detected in real time
- Decisions become reactive
- Reports explain what happened.
After it already cost you

That's not bad management.
It's flying blind.

Failures cost **money**
every single day.

Without centralized monitoring:

- Higher FCR
- Higher mortality
- Lower uniformity
- Less predictable output
- Inconsistent results across farms and houses

With Monitor One*:

- +5% to +8% production increase
- Up to 3% FCR improvement
- Up to 75% improvement in weight uniformity
- Lower mortality
- Final-weight prediction starting day 21
- More stable, repeatable results
- Real process control - house by house

Monitor One at operational scale

650.000+ ha monitored (1.6M+ acres)

2,000+ poultry houses connected

4.55M m² monitored area (49M ft²)

3,800+ silos monitored

140,000,000+ data points per day

50,000+ sensors deployed

Not projections. Not pilots

This is real customer data from live operations.

Too much **data**, Too little **action**.

Today, producers face:

- Labor shortages and high turnover
- Higher performance targets
- Increasing pressure on animal welfare
- Disconnected systems and siloed information

Data isn't enough.

Turn it into timely decisions.

A Real-Time Operations Center (RTOC). For the entire **operation**.

Monitor One centralizes your operation in one place:

- Production data
- Existing and proprietary sensors
- Critical alerts
- Key operational KPIs

Decisions stop depending on reports - or who happens to be on shift.

Everyone acts using the same criteria, **across all farms.**

**You don't just
see what
happened
You see
what's
coming.**

Monitor One enables you to:

- Predict final weight
- Project weekly results
- Detect deviations before the critical day

*“Anticipation isn't technology.
It's a sustainable competitive
advantage.”*

**What isn't
measured can't be
improved.**

**What isn't analyzed
can't be decided.**

**And what you see too
late... already costs you.**

Let's talk now

Discover how **Monitor One** helps you see ahead and decide while there's still time to act.
